Lab Exercise 8- Creating and Managing a ReplicaSet in Kubernetes

Objective:

A ReplicaSet in Kubernetes ensures a specified number of Pod replicas are running at any given time. This exercise will guide you through creating a ReplicaSet to maintain the desired state of your application.

- Understand the syntax and structure of a Kubernetes ReplicaSet definition file (YAML).
- Learn how to create and manage a ReplicaSet to ensure application availability.
- Understand how a ReplicaSet helps in scaling applications and maintaining desired states.

Prerequisites

- Kubernetes Cluster: Have a running Kubernetes cluster (locally using Minikube or kind, or a cloud-based service).
- kubectl: Install and configure kubectl to interact with your Kubernetes cluster.
- Basic Knowledge of YAML: Familiarity with YAML format will be helpful for understanding Kubernetes resource definitions.

Step-by-Step Guide

Step 1: Understanding ReplicaSet

A ReplicaSet ensures a specified number of Pod replicas are running at any given time. If a Pod crashes or is deleted, the ReplicaSet creates a new one to meet the defined number of replicas. This helps maintain application availability and ensures that your application can handle increased load by distributing traffic among multiple Pods.

Step 2: Create a ReplicaSet

We'll define a ReplicaSet to maintain three replicas of a simple Nginx web server Pod. Create a YAML file named nginx-replicaset.yaml with the following content:

```
apiVersion: apps/v1
                       # Specifies the API version used.
kind: ReplicaSet
                     # The type of resource being defined; here, it's a ReplicaSet.
metadata:
name: nginx-replicaset # The name of the ReplicaSet.
spec:
replicas: 3
                  # The desired number of Pod replicas.
selector:
                     # Criteria to identify Pods managed by this ReplicaSet.
 matchLabels:
                   # The label that should match Pods.
   app: nginx
 template:
                  # The Pod template for creating new Pods.
  metadata:
   labels:
                   # Labels applied to Pods created by this ReplicaSet.
    app: nginx
  spec:
   containers:
                    # Name of the container within the Pod.
   - name: nginx
    image: nginx:latest # Docker image to use for the container.
    ports:
    - container Port: 80 # The port the container exposes.
```

Explanation:

- apiVersion: Defines the API version (apps/v1) used for the ReplicaSet resource.
- kind: Specifies that this resource is a ReplicaSet.
- metadata: Contains metadata about the ReplicaSet, including name.

- o name: The unique name for the ReplicaSet.
- spec: Provides the specification for the ReplicaSet.
 - o replicas: Defines the desired number of Pod replicas.
 - o selector: Criteria for selecting Pods managed by this ReplicaSet.
 - matchLabels: Labels that Pods must have to be managed by this ReplicaSet.
 - o template: Defines the Pod template used for creating new Pods.
 - metadata: Contains metadata for the Pods, including labels.
 - labels: Labels applied to Pods created by this ReplicaSet.
 - o spec: Specification for the Pods.
 - containers: Lists the containers that will run in the Pod.
 - name: The unique name of the container within the Pod.
 - image: The Docker image used for the container.
 - ports: Ports exposed by the container.

Step 3: Apply the YAML to Create the ReplicaSet

Use the kubectl apply command to create the ReplicaSet based on the YAML file.

```
kubectl apply -f nginx-replicaset.yaml
```

```
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl apply -f replica.yaml replicaset.apps/nginx-replicaset created
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> |
```

Verify the ReplicaSet is running and maintaining the desired number of replicas:

```
kubectl get replicaset
```

```
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl get replicaset
NAME DESIRED CURRENT READY AGE
nginx-replicaset 3 3 3 45s
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>|
```

This command lists all ReplicaSets in the current namespace.

To check the Pods created by the ReplicaSet:

```
kubectl get pods -l app=nginx
```

This command lists all Pods with the label app=nginx.

```
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
                                                             kubectl get pods
NAME
                          READY
                                  STATUS
                                             RESTARTS
                                                         AGE
my-pod
                          1/1
                                  Running
                                                         54m
                          1/1
nginx-replicaset-b4t24
                                             0
                                  Running
                                                         70s
nginx-replicaset-b82wf
                                             0
                                                         70s
                          1/1
                                  Running
nginx-replicaset-xtxjh
                          1/1
                                             0
                                  Running
                                                         70s
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
                                                             kubectl get pods -l app=nginx
                          READY
                                  STATUS
                                             RESTARTS
                                                        AGE
nginx-replicaset-b4t24
                                   Running
nginx-replicaset-b82wf
                          1/1
                                             0
                                                         ЯЦς
                                  Running
nginx-replicaset-xtxjh
                                             0
                          1/1
                                  Running
                                                         84s
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
```

Step 4: Managing the ReplicaSet

1. Scaling the ReplicaSet

You can scale the number of replicas managed by the ReplicaSet using the kubectl scale command.

```
kubectl scale --replicas=5 replicaset/nginx-replicaset
```

```
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl scale --replicas=5 replicaset/nginx-replicaset replicaset.apps/nginx-replicaset scaled
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
```

This command scales the ReplicaSet to maintain 5 replicas. Verify the scaling operation:

```
kubectl get pods -l app=nginx
      C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> <mark>kubect</mark>l scale --replicas=5 replicaset/nginx-replicaset
  replicaset.apps/nginx-replicaset scaled
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl get pods -l app=nginx
                                                           RESTARTS
                                   READY
                                              STATUS
  nginx-replicaset-b4t24
                                              Running
                                                                          2m58s
  nginx-replicaset-b82wf
nginx-replicaset-cmzrs
nginx-replicaset-mcgcj
                                              Running
                                                                          2m58s
                                              Running
                                                                          29s
                                              Running
                                                                          29s
   gginx-replicaset-xtxjh 1/1 Running 0 2/58
8'S C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
                                                                          2m58s
```

You should see that the number of Pods has increased to 5.

2. Updating the ReplicaSet

If you need to update the Pod template (e.g., to use a different Docker image version), modify the YAML file and apply it again. For instance, change the image to a specific version of Nginx:

```
spec:
template:
spec:
containers:
- name: nginx
image: nginx:1.19.3 # Change to a specific version
```

Apply the changes:

```
kubectl apply -f nginx-replicaset.yaml
```

Check the status to ensure the Pods are updated:

```
kubectl get pods -l app=nginx
```

```
C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl apply -f replica.yaml
replicaset.apps/nginx-replicaset configured
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl get pods -l app=nginx
                         READY
                                 STATUS
                                           RESTARTS
                                                       AGE
nginx-replicaset-b4t24
                                                       4m13s
                                 Running
                                 Running
nginx-replicaset-b82wf
                                                       4m13s
nginx-replicaset-xtxjh
                                 Running
                                           0
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8>
```

Note: Updating a ReplicaSet doesn't automatically replace existing Pods with new ones. In practice, you often create a new ReplicaSet or Deployment for updates.

3. Deleting the ReplicaSet

To clean up the ReplicaSet and its Pods, use the kubectl delete command:

```
kubectl delete -f nginx-replicaset.yaml
```

This command deletes the ReplicaSet and all the Pods managed by it.

```
PS C:\Users\KHUSHI JÁIN\OneDrive\Desktop\Docker_lab\lab8> kubectl delete -f replica.yaml
replicaset.apps "nginx-replicaset" deleted
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> kubectl get pods -l app=nginx
No resources found in default namespace.
PS C:\Users\KHUSHI JAIN\OneDrive\Desktop\Docker_lab\lab8> |
```
