EXPERIMENT – 6

Creating POD in Kubernetes

Objective:

- Understand the basic structure and syntax of a Kubernetes Pod definition file (YAML).
- Learn to create, inspect, and delete a Pod in a Kubernetes cluster.

Prerequisites

- Kubernetes Cluster: You need a running Kubernetes cluster. You can set up a local cluster using tools like Minikube or kind, or use a cloud-based Kubernetes service.
- kubectl: Install and configure kubectl to interact with your Kubernetes cluster.
- Basic Knowledge of YAML: Familiarity with YAML format will be helpful as Kubernetes resource definitions are written in YAML.

Step-by-Step Guide

Step 1: Create a YAML File for the Pod

We'll create a Pod configuration file named **pod-example.yaml**

```
apiVersion: v1      # The version of the Kubernetes API to use for this object.

kind: Pod          # The type of Kubernetes object. Here it's a Pod.

metadata:          # Metadata about the Pod, such as its name and labels.

 name: my-pod       # The name of the Pod. Must be unique within a namespace.
```

labels: # Labels are key-value pairs to categorize and organize Pods.

  app: my-app   # Label to categorize this Pod as part of 'my-app'.

spec: # The specification for the Pod, detailing its containers and other settings.

 containers: # List of containers that will run in this Pod.

  - name: my-container # The name of the container. Must be unique within the Pod.

    image: nginx:latest # The Docker image to use for this container. Here, it's the latest version of Nginx.

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ mkdir exp6

anshi@HP MINGW64 /e/Academics/Docker Lab
$ nano pod-example.yaml
```

```
  GNU nano 7.2                          pod-example.yaml
apiVersion: v1              # The version of the Kubernetes API to use for this obj>
kind: Pod                   # The type of Kubernetes object. Here it's a Pod.
metadata:                   # Metadata about the Pod, such as its name and labels.
  name: my-pod              # The name of the Pod. Must be unique within a namespac>
  labels:                   # Labels are key-value pairs to categorize and organize>
    app: my-app             # Label to categorize this Pod as part of 'my-app'.
spec:                       # The specification for the Pod, detailing its containe>
  containers:               # List of containers that will run in this Pod.
    - name: my-container # The name of the container. Must be unique within the>
      image: nginx:latest # The Docker image to use for this container. Here, i>
```

Explanation of the YAML File

- apiVersion: Specifies the version of the Kubernetes API to use. For Pods, it's typically v1.
- kind: The type of object being created. Here it's a Pod.
- metadata: Provides metadata about the object, including name and labels. The name must be unique within the namespace, and labels help in identifying and organizing Pods.
- spec: Contains the specifications of the Pod, including:

- o containers: Lists all containers that will run inside the Pod. Each container needs:
  - name: A unique name within the Pod.
  - image: The Docker image to use for the container.
  - ports: The ports that this container exposes.
  - env: Environment variables passed to the container.

Step 2: Apply the YAML File to Create the Pod

Use the kubectl apply command to create the Pod based on the YAML configuration file.

kubectl apply -f pod-example.yaml

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl apply -f pod-example.yaml
pod/my-pod created
```

This command tells Kubernetes to create a Pod as specified in the pod-example.yaml file.

Step 3: Verify the Pod Creation

To check the status of the Pod and ensure it's running, use:

kubectl get pods

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl get pods
NAME      READY    STATUS            RESTARTS   AGE
my-pod    0/1      ContainerCreating  0          22s
```

This command lists all the Pods in the current namespace, showing their status, restart count, and other details.

Get detailed information about the Pod using:

kubectl describe pod my-pod

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl describe pod my-pod
Name:           my-pod
Namespace:      default
Priority:       0
Service Account: default
Node:           docker-desktop/192.168.65.3
Start Time:     Tue, 05 Nov 2024 23:12:38 +0530
Labels:         app=my-app
Annotations:    <none>
Status:         Running
IP:             10.1.0.14
IPs:
  IP:   10.1.0.14
Containers:
  my-container:
    Container ID:   docker://1a0b7f946d0b4b5c9ffc90d7c6cf4314aea260aac2c47e532c3
558d1d4a613ae
    Image:          nginx:latest
    Image ID:       docker-pullable://nginx@sha256:28402db69fec7c17e179ea8788266
7f1e054391138f77ffaf0c3eb388efc3ffb
    Port:           <none>
    Host Port:      <none>
    State:          Running
      Started:      Tue, 05 Nov 2024 23:13:07 +0530
    Ready:          True
    Restart Count:  0
    Environment:    <none>
    Mounts:
      /var/run/secrets/kubernetes.io/serviceaccount from kube-api-access-tb2w8 (
ro)
Conditions:
  Type              Status
  Initialized       True
  Ready             True
  ContainersReady   True
  PodScheduled      True
Volumes:
  kube-api-access-tb2w8:
    Type:                    Projected (a volume that contains injected data fro
m multiple sources)
    TokenExpirationSeconds:  3607
    ConfigMapName:           kube-root-ca.crt
    ConfigMapOptional:       <nil>
    DownwardAPI:             true
QoS Class:                   BestEffort
Node-Selectors:              <none>
Tolerations:                 node.kubernetes.io/not-ready:NoExecute op=Exists fo
r 300s
                             node.kubernetes.io/unreachable:NoExecute op=Exists
for 300s
Events:
```

This command provides detailed information about the Pod, including its events, container specifications, and resource usage.

Step 4: Interact with the Pod

You can interact with the running Pod in various ways, such as accessing the logs or executing commands inside the container.

View Logs: To view the logs of the container in the Pod:

kubectl logs my-pod

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl logs my-pod
/docker-entrypoint.sh: /docker-entrypoint.d/ is not empty, will attempt to perform configuration
/docker-entrypoint.sh: Looking for shell scripts in /docker-entrypoint.d/
/docker-entrypoint.sh: Launching /docker-entrypoint.d/10-listen-on-ipv6-by-default.sh
10-listen-on-ipv6-by-default.sh: info: Getting the checksum of /etc/nginx/conf.d/default.conf

2024/11/05 17:43:07 [notice] 1#1: start worker process 33
2024/11/05 17:43:07 [notice] 1#1: start worker process 34
2024/11/05 17:43:07 [notice] 1#1: start worker process 35
2024/11/05 17:43:07 [notice] 1#1: start worker process 36

anshi@HP MINGW64 /e/Academics/Docker Lab
```

Execute a Command: To run a command inside the container:

kubectl exec -it my-pod -- /bin/bash

The -it flag opens an interactive terminal session inside the container, allowing you to run commands.

Step 5: Delete the Pod

To clean up and remove the Pod when you're done, use the following command:

kubectl delete pod my-pod

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl delete pod my-pod
pod "my-pod" deleted
```

Confirming deletion –

```
anshi@HP MINGW64 /e/Academics/Docker Lab
$ kubectl get pods
No resources found in default namespace.
```

This command deletes the specified Pod from the cluster.
